Indication
Erivedge is a prescription medicine used to treat adults with a type of skin cancer, called basal cell carcinoma, that has spread to other parts of the body or that has come back after surgery or that your healthcare provider decides cannot be treated with surgery or radiation.

It is not known if Erivedge is safe and effective in children.

Serious Side Effects
Erivedge can cause your baby to die before it is born (be stillborn) or cause your baby to have severe birth defects.

Please see accompanying full Prescribing Information for additional Important Safety Information, including serious side effects, and the Medication Guide.
GETTING STARTED ON ERIVEDGE

Before you start treatment, be sure to discuss all of the current medicines you take—including prescription and nonprescription medicines, vitamins, and herbal supplements—with your doctor or other healthcare provider. It’s important that you follow his or her recommendations during treatment.

Learn about common side effects

Inside this brochure, you’ll find important safety information, including a list of the most common side effects of Erivedge, along with some tips you can try.

Keep these things in mind:

• When it comes to side effects, individual results may vary. Please note that these are not all of the possible side effects of Erivedge
• If you are experiencing any side effects that concern or bother you, please be sure to talk to your doctor or other healthcare provider
• Remember that these tips may not work for everyone. Before you try any of the tips mentioned in this brochure, be sure to talk with your doctor or other healthcare provider

Talk to registered nurses*

Call the Erivedge Patient Support Line at (855) 7-ERIVEDGE (or 855-737-4833) Monday through Friday, 9 AM to 9 PM ET.

*This brochure and the Erivedge Patient Support Line are for educational purposes only and are not intended to provide medical advice or replace the medical advice of your doctor or other healthcare provider, who should always be your primary source of information about your health, diagnosis, and treatment.

Select Important Safety Information

What is the most important information I should know about Erivedge?

• Erivedge can cause your baby to die before it is born (be stillborn) or cause your baby to have severe birth defects
**MUSCLE SPASMS**

Muscle spasms are when the muscle tightens, like with a cramp. They may be painful.

**Some tips you can try:**

- Drink plenty of fluids
- Apply heat when the muscle spasm begins, and ice after it has passed
- Exercise within your ability
- Stretch to improve flexibility

---

**HAIR LOSS**

Hair loss (also called alopecia) may happen on any part of the body. It may happen suddenly or a little at a time and may cause the hair to become thin, dry, or dull.

**Some tips you can try:**

- Use a mild shampoo, and try not to wash your hair each day
- Avoid perming, curling, straightening, or blow-drying with high heat
- Apply a broad-spectrum sunscreen to the scalp, or cover the scalp with a sun-protective hat or scarf when outside

---

**Massage Therapy**

Many patients experiencing muscle spasms may find massage therapy helpful. There are also simple massage techniques your loved ones could help with at home, including gentle, smooth, circular rubbing of the hands, feet, or back. You could even massage yourself by applying light, even pressure to your hands, arms, neck, and forehead.

Ask your doctor or other healthcare provider about seeing a massage therapist, and if any massage is appropriate for you.

---

**Talk to Your Hairstylist**

If you experience hair loss and are interested in wearing a wig, consider speaking with your hairstylist. He or she can help you find where to buy your wig and may even be able to cut and shape the wig to fit your style.

---

**Select Important Safety Information (cont’d)**

- For females who can become pregnant, talk with your healthcare provider about the risks of Erivedge to your unborn child. Your healthcare provider will do a pregnancy test before you start taking Erivedge. Avoid pregnancy by using birth control during treatment and for 24 months after your final dose. Tell your healthcare provider right away if you have unprotected sex or think that your birth control has failed
TASTE CHANGES

You may experience changes in how things taste, or a loss of taste can also occur. Some people may notice a metallic or chemical taste.

Some tips you can try:

- Try cold or frozen foods, rather than hot foods—remember that different food temperatures work for different people. Be sure to do what works best for you.
- Flavor foods with herbs and spices or by marinating them in juices or salad dressings.
- Drink fluids to rinse away unpleasant tastes. Fruit-flavored drinks work well.
- Try using plastic utensils and containers if you have a metallic taste in your mouth.
- Keep your mouth clean by brushing and flossing more often during the day.
- Try foods again. Something may have tasted funny yesterday but will taste better later.

Cold Food Ideas

Much of the way a food tastes comes from its smell. So, eating cold foods can help if you are overwhelmed by the flavor of food.

Try these:
- Tuna salad
- Chicken salad
- Pasta salad
- Milkshakes
- Pudding or custard
- Yogurt
- Egg salad
- Deviled eggs
- Ice cream
- Cheese
- Cottage cheese

WEIGHT LOSS

Weight loss is another side effect that may be caused by your treatment. For example, if foods or drinks do not taste good, you may eat less and lose weight.

Some tips you can try:

- Eat smaller meals more often.
- Drink healthy high-calorie fluids between meals. Try nutritional supplement drinks, such as instant breakfast mixes or powdered shakes.
- Eat foods that are nutritious and high in calories, such as dried fruit, yogurt, or granola bars, or add maple syrup to your favorite snacks.

On-the-Trail Mix

You can make your own trail mix using just a few nutritious ingredients.

Try these:
- Dried fruits, such as raisins, banana chips, or prunes
- Nuts, such as almonds, peanuts, or walnuts
- Bite-sized pretzels
- You can even add a small amount of candy, such as chocolate chips

Select Important Safety Information (cont’d)

- For males, Erivedge is present in semen. Do not donate semen while you are taking Erivedge and for 3 months after your final dose. You should always use a condom, even if you have had a vasectomy, during sex with female partners who are pregnant or who are able to become pregnant, during treatment with Erivedge, and for 3 months after your final dose to protect your female partner from being exposed to Erivedge.
- Tell your healthcare provider right away if you or your female partner could be pregnant or thinks she is pregnant while you are taking Erivedge.
FATIGUE

Fatigue is a feeling of being tired or exhausted that may affect your ability to perform normal activities.

Some tips you can try:

• Be physically active each day if your doctor or other healthcare provider approves. This may help improve appetite, strength, and weight
• Do activities during the time of day when you have more energy
• Do the most important tasks first

Balance Rest and Activity

• Work with your doctor or other healthcare provider to design an appropriate exercise plan. Consider taking a walk each day or doing other light exercise
• If you need a nap, take one. Just try to keep it short so you can still get a good night’s sleep
• Your food and beverage choices can make a difference (for instance, you may want to avoid caffeine)

NAUSEA OR VOMITING

Some patients will experience nausea or vomiting. This means feeling sick to your stomach or throwing up.

Some tips you can try:

• Try relaxation techniques, such as deep breathing or thinking of a positive image or scene, to distract you from feeling sick to your stomach
• Ask your doctor or other healthcare provider if an antinausea medicine might help
• Choose foods that are nutritious, instead of foods that are greasy, fried, salty, sweet, or spicy
• If the smell of a food bothers you, try cooling it down before eating it

Stay Hydrated

• Keep a water bottle at your side throughout the day
• Sports drinks that are high in electrolytes can also help
• Drink clear liquids, such as tea. Or try something with ginger in it, such as ginger ale

Select Important Safety Information (cont’d)

What should I tell my healthcare provider before taking Erivedge?

• If you are pregnant or plan to become pregnant
• If you are breastfeeding or plan to breastfeed. You should not breastfeed during treatment and for 24 months after your final dose of Erivedge.
• About all the medicines you take

Select Important Safety Information (cont’d)

Exposure to Erivedge during pregnancy:
If you become pregnant during treatment with Erivedge, you or your healthcare provider should report your pregnancy to Genentech at (888) 835-2555.
**DIARRHEA**

When you have diarrhea, it means you have loose or watery bowel movements that happen 3 or more times in a day.

**Some tips you can try:**
- Choose nutritious foods, rather than foods that are greasy, fatty, or spicy
- Eat small, frequent meals of foods that are easy to digest, such as rice, applesauce, and canned fruit
- Drink plenty of clear, noncarbonated fluids
- Eat foods high in potassium, such as bananas or potatoes, or drink sports drinks

---

**CHANGES IN APPETITE**

You may also experience a change in appetite. This can include changes in how much or how often you eat, or in how hungry or full you feel.

**Some tips you can try:**
- Keep food and fluids on hand, and snack when you are hungry
- Eat snacks that are high in calories and protein, such as dried fruit, nuts, yogurt, eggs, and cheese
- Try asking a friend or family member to cook for you if you do not feel well

---

**The B.R.A.T. Diet**

This simple diet may help with your diarrhea, and it's very easy to remember. Just focus on these 4 foods:
- Bananas
- Applesauce
- Rice
- Toast

**Banana Milkshake**

**Ingredients:** 1 whole ripe banana, vanilla extract (a few drops), 1 cup milk

**Steps:** Put all ingredients into a blender. Blend at high speed until smooth

**Note:** Made with whole milk: 255 calories and 9 grams of protein

---

**Select Important Safety Information (cont’d)**

**What should I avoid while taking Erivedge?**
- Do not donate blood or blood products while you are taking Erivedge and for 24 months after your final dose
- Do not donate semen while you are taking Erivedge and for 3 months after your final dose

**What are the possible side effects of Erivedge?**
- **Bone growth problems.** Bone growth problems have happened in children who have been exposed to Erivedge. These problems may continue even after stopping treatment with Erivedge
- **Diabetes**
- **Decreased appetite**
- **Constipation**
- **Joint pain**
- **Vomiting**

---

**Select Important Safety Information (cont’d)**

The most common side effects of Erivedge are:
- Muscle spasms
- Hair loss
- Change in how things taste or loss of taste
- Weight loss
- Tiredness
- Nausea
**Constipation**

You may become constipated during treatment and find that you have difficulty having a bowel movement.

**Some tips you can try:**

- Drink plenty of liquids
- Eat high-fiber foods, such as whole-grain breads and cereals, fruits and vegetables, and nuts, seeds, and popcorn
- Be physically active if you can

**Apple Prune Sauce**

**Ingredients:** 1/3 cup unprocessed bran, 1/3 cup applesauce, 1/3 cup mashed, stewed prunes

**Steps:** Blend all ingredients and store in a refrigerator. Take 1 to 2 tablespoons of this mixture before bedtime, and then drink 8 ounces of water

**Note:** Make sure you drink the water, or this recipe will not work to relieve constipation

---

**Joint Pain**

Joint pain may occur. For some patients this may be mild, and for others it can be more severe.

**Some tips you can try:**

- Try hot or cold packs to ease pain and reduce swelling
- Be physically active if you can
- Try to maintain a healthy weight

**Yoga**

Patients who experience joint pain may find yoga helpful. **Yoga classes are offered at some cancer centers.** Ask your doctor or other healthcare provider about yoga classes that may be appropriate for your symptoms.

---

**Select Important Safety Information (cont’d)**

Erivedge can cause absence of menstrual periods (amenorrhea) in females who are able to become pregnant. It is not known if amenorrhea is permanent. Talk to your healthcare provider if you have concerns about fertility.

These are not all of the possible side effects of Erivedge. Because everyone is different, it is not possible to predict what side effects any one person will have or how severe they may be. Call your doctor for medical advice about side effects.
ADDITIONAL SUPPORT

The Erivedge Cares Program* is a free program designed to support you throughout treatment by providing educational resources and other tools.

Your patients will have access to:

Educational resources
These brochures provide additional information about Erivedge.

A personal story
Patients can read the story of a patient who has taken Erivedge.

*The Erivedge Cares Program is for educational purposes only; it is not intended to provide medical advice or to be a substitute for the guidance you provide to your patients.

How can patients enroll in this program?
Patients can enroll either by visiting www.Erivedge.com or filling out the Patient Authorization and Notice of Release of Information (PAN) form.

If you have questions or concerns about these or any other side effects, talk with your doctor or other healthcare provider. There may be things he or she can do to help. Before you try any of the side effect tips mentioned in this brochure, talk with your doctor or other healthcare provider. These are not all of the possible side effects of Erivedge.

Select Important Safety Information (cont’d)
You may report side effects to the FDA at (800) FDA-1088 or www.fda.gov/medwatch. You may also report side effects to Genentech at (888) 835-2555.

Please see accompanying full Prescribing Information for additional Important Safety Information, including serious side effects, and the Medication Guide.
Indication
Erivedge is a prescription medicine used to treat adults with a type of skin cancer, called basal cell carcinoma, that has spread to other parts of the body or that has come back after surgery or that your healthcare provider decides cannot be treated with surgery or radiation.

It is not known if Erivedge is safe and effective in children.

Serious Side Effects
Erivedge can cause your baby to die before it is born (be stillborn) or cause your baby to have severe birth defects.

ERIVEDGE® (vismodegib) capsule for oral use
Initial U.S. Approval: 2012

HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use ERIVEDGE safely and effectively. See full prescribing information for ERIVEDGE.

WARNING: EMBRYO-FETAL TOXICITY
See full prescribing information for complete boxed warning.
ERIVEDGE can cause embryo-fetal death or severe birth defects when administered to a pregnant woman. ERIVEDGE is embryotoxic, fetotoxic, and teratogenic in animals. Teratogenic effects included severe midline defects, missing digits, and other irreversible malformations.

Verify the pregnancy status of females of reproductive potential within 7 days prior to initiating ERIVEDGE therapy. Advise females of reproductive potential to use effective contraception during and after ERIVEDGE therapy. Advise males of the potential risk of ERIVEDGE exposure through semen and to use condoms with a pregnant partner or a female partner of reproductive potential. Advise pregnant women of the potential risks to a fetus. (5.1, 5.3, 8.1, 8.3)

RECENT MAJOR CHANGES

Warnings and Precautions
Embry-Fetal Toxicity (5.1) 11/2016
Blood Donation (5.2) 11/2016
Premature Fusion of the Epiphyses (5.4) 11/2016

INDICATIONS AND USAGE
ERIVEDGE® (vismodegib) capsule is a hedgehog pathway inhibitor indicated for the treatment of adults with metastatic basal cell carcinoma, or with locally advanced basal cell carcinoma that has recurred following surgery or who are not candidates for surgery, and who are not candidates for radiation. (1)

DOSAGE AND ADMINISTRATION
The recommended dose is 150 mg orally once daily. (2)

DOSAGE FORMS AND STRENGTHS
150 mg capsules. (3)

CONTRAINDICATIONS
None.

WARNINGS AND PRECAUTIONS
• Blood donation: Advise patients not to donate blood or blood products while receiving ERIVEDGE and for 24 months after the final dose of ERIVEDGE. (5.2)
• Semen donation: Advise males not to donate semen during and for 3 months after therapy (5.3, 8.3)
• Premature fusion of the epiphyses (5.4, 6.2, 8.4)

ADVERSE REACTIONS
The most common adverse reactions (incidence of ≥ 10%) are muscle spasms, alopecia, dysgeusia, weight loss, fatigue, nausea, diarrhea, decreased appetite, constipation, arthralgias, vomiting, and ageusia.

To report SUSPECTED ADVERSE REACTIONS, contact Genentech, Inc. at 1-888-835-2555 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

USE IN SPECIFIC POPULATIONS
• Lactation: Breastfeeding not recommended. (8.2)
• Females and Males of Reproductive Potential: May cause amenorrhea in females. (8.3)

See Section 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling (Medication Guide).

WARNING: EMBRYO-FETAL TOXICITY

ERIVEDGE can cause embryo-fetal death or severe birth defects when administered to a pregnant woman. ERIVEDGE is embryotoxic, fetotoxic, and teratogenic in animals. Teratogenic effects included severe midline defects, missing digits, and other irreversible malformations.

Verify the pregnancy status of females of reproductive potential within 7 days prior to initiating ERIVEDGE therapy. Advise females of reproductive potential to use effective contraception during and after ERIVEDGE therapy. Advise males of the potential risk of ERIVEDGE exposure through semen and to use condoms with a pregnant partner or a female partner of reproductive potential. Advise pregnant women of the potential risks to a fetus. [See Warnings and Precautions (5.1, 5.3), Use in Specific Populations (8.1, 8.3)].

1  INDICATIONS AND USAGE

ERIVEDGE capsule is indicated for the treatment of adults with metastatic basal cell carcinoma, or with locally advanced basal cell carcinoma that has recurred following surgery or who are not candidates for surgery, and who are not candidates for radiation.

2  DOSAGE AND ADMINISTRATION

The recommended dose of ERIVEDGE is 150 mg taken orally once daily until disease progression or until unacceptable toxicity [see Clinical Studies (14)].

ERIVEDGE may be taken with or without food. Swallow capsules whole. Do not open or crush capsules.

If a dose of ERIVEDGE is missed, do not make up that dose; resume dosing with the next scheduled dose.

3  DOSAGE FORMS AND STRENGTHS

ERIVEDGE (vismodegib) capsules, 150 mg. The capsule has a pink opaque body and a grey opaque cap, with “150 mg” printed on the capsule body and “VISMO” printed on the capsule cap in black ink.

4  CONTRAINDICATIONS

None.

5  WARNINGS AND PRECAUTIONS

5.1  Embryo-Fetal Toxicity

Based on its mechanism of action, ERIVEDGE can cause embryo-fetal death or severe birth defects when administered to a pregnant woman. In animal reproduction studies, vismodegib was embryotoxic, fetotoxic, and teratogenic at maternal exposures lower than the human exposures at the recommended dose of 150 mg/day.

Verify the pregnancy status of females of reproductive potential within 7 days prior to initiating ERIVEDGE therapy. Advise females of reproductive potential to use effective contraception during therapy with ERIVEDGE and for 24 months after the final dose. Advise male patients to use condoms, even after a vasectomy, to avoid potential drug exposure in pregnant partners and female
partners of reproductive potential during therapy and for 3 months after the final dose of ERIVEDGE. Advise pregnant women of the potential risk to a fetus [see Use in Specific Populations (8.1, 8.3) and Clinical Pharmacology (12.1)].

5.2 Blood Donation
Advise patients not to donate blood or blood products while receiving ERIVEDGE and for 24 months after the final dose of ERIVEDGE.

5.3 Semen Donation
Vismodegib is present in semen. It is not known if the amount of vismodegib in semen can cause embryo-fetal harm. Advise male patients not to donate semen during and for 3 months after the final dose of ERIVEDGE [see Use in Specific Populations (8.1, 8.3)].

5.4 Premature Fusion of the Epiphyses
Premature fusion of the epiphyses has been reported in pediatric patients exposed to ERIVEDGE. In some cases, fusion progressed after drug discontinuation [see Adverse Reactions (6.2) and Use in Specific Populations (8.4)].

6 ADVERSE REACTIONS
6.1 Clinical Trials Experience
Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice.

ERIVEDGE capsule was administered as monotherapy at doses ≥ 150 mg orally daily in four open-label, uncontrolled, dose-ranging or fixed single dose clinical trials enrolling a total of 138 patients with advanced basal cell carcinoma (BCC). The median age of these patients was 61 years (range 21 to 101), 100% were White (including Hispanics), and 64% were male. The median duration of treatment was approximately 10 months (305 days; range 0.7 to 36 months); 111 patients received ERIVEDGE for 6 months or longer.

The most common adverse reactions (≥ 10%) were muscle spasms, alopecia, dysgeusia, weight loss, fatigue, nausea, diarrhea, decreased appetite, constipation, arthralgias, vomiting, and ageusia (Table 1).
Table 1: Adverse Reactions Occurring in ≥ 10% of Advanced BCC Patients

<sup>1</sup>aBCC = Advanced Basal Cell Carcinoma.

<sup>2</sup>MedDRA = Medical Dictionary for Regulatory Activities.

<sup>3</sup>Grading according to NCI-CTCAE v3.0.

**Amenorrhea:**

In clinical trials, a total of 3 of 10 pre-menopausal women developed amenorrhea while receiving ERIVEDGE [see Non-Clinical Toxicology (13.1)].

**Laboratory Abnormalities:**

Treatment-emergent Grade 3 laboratory abnormalities observed in clinical trials were hyponatremia in 6 patients (4%), hypokalemia in 2 patients (1%), and azotemia in 3 patients (2%).

Additionally, in a post-approval clinical trial conducted in 1232 patients with locally advanced or metastatic BCC treated with ERIVEDGE, a subset of 29 patients had baseline values for CPK reported. Within the subset of patients, 38% had a shift from baseline, and one of the patients had a Grade 3 value. The prevalence of Grade 3/4 CPK elevation across the entire study population with any CPK measurement was 2.4% (11 out of 453 patients).
6.2 Postmarketing Experience

The following adverse reactions have been identified during post-approval use of ERIVEDGE. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

Musculoskeletal and connective tissue disorders: Premature fusion of the epiphyses [see Warnings and Precautions (5.4) and Use in Specific Populations (8.4)].

Investigations: blood creatine phosphokinase increased

7 DRUG INTERACTIONS

Clinically relevant pharmacokinetic interactions are not expected between vismodegib and a substrate, inducer or inhibitor of cytochrome 450 enzymes or an inhibitor of P-glycoprotein (P-gp) or between vismodegib and gastric pH elevating agents [see Clinical Pharmacology (12.3)].

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Risk Summary

Based on its mechanism of action and animal reproduction studies, ERIVEDGE can cause fetal harm when administered to a pregnant woman [see Clinical Pharmacology (12.1)]. In animal reproduction studies, oral administration of vismodegib during organogenesis at doses below the recommended human dose resulted in embryotoxicity, fetotoxicity, and teratogenicity in rats [see Data]. There are no human data on the use of ERIVEDGE in pregnant women. Advise pregnant women of the potential risk to a fetus. Report pregnancies to Genentech at 1-888-835-2555.

The background risk of major birth defects and miscarriage for the indicated population is unknown. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2-4% and 15-20%, respectively.

Data

Animal Data

In an embryo-fetal developmental toxicity study, pregnant rats were administered vismodegib orally at doses of 10, 60, or 300 mg/kg/day during the period of organogenesis. Pre- and post-implantation loss were increased at doses of ≥ 60 mg/kg/day (approximately ≥ 2 times the systemic exposure (AUC) in patients at the recommended human dose), which included early resorption of 100% of the fetuses. A dose of 10 mg/kg/day (approximately 0.2 times the AUC in patients at the recommended dose) resulted in malformations (including missing and/or fused digits, open perineum and craniofacial anomalies) and retardations or variations (including dilated renal pelvis, dilated ureter, and incompletely or unossified sternal elements, centra of vertebrae, or proximal phalanges and claws).

8.2 Lactation

No data are available regarding the presence of vismodegib in human milk, the effects of the drug on the breastfed infant, or the effects of the drug on milk production. Because of the potential for serious adverse reactions in breastfed infants from ERIVEDGE, advise a nursing woman that breastfeeding is not recommended during therapy with ERIVEDGE and for 24 months after the final dose.
8.3 Females and Males of Reproductive Potential

Pregnancy Testing
Verify the pregnancy status of females of reproductive potential within 7 days prior to initiating ERIVEDGE therapy.

Contraception

Females
Based on its mechanism of action and animal data, ERIVEDGE can cause fetal harm when administered to a pregnant woman [see Use in Specific Populations (8.1)]. Advise females of reproductive potential to use effective contraception during therapy and for 24 months after the final dose of ERIVEDGE.

Males
Vismodegib is present in semen [see Clinical Pharmacology (12.3)]. It is not known if the amount of vismodegib in semen can cause embryo-fetal harm. Advise male patients to use condoms, even after a vasectomy, to avoid drug exposure to pregnant partners and female partners of reproductive potential during therapy with and for 3 months after the final dose of ERIVEDGE. Advise males of the potential risk to an embryo or fetus if a female partner of reproductive potential is exposed to ERIVEDGE. Advise males not to donate semen during therapy with and for 3 months after the final dose of ERIVEDGE.

Infertility

Females
Amenorrhea can occur in females of reproductive potential. Reversibility of amenorrhea is unknown [see Adverse Reactions (6)].

8.4 Pediatric Use

The safety and effectiveness of ERIVEDGE capsule have not been established in pediatric patients. Premature fusion of the epiphyses has been reported in pediatric patients exposed to ERIVEDGE. In some cases, fusion progressed after drug discontinuation. [see Warnings and Precautions (5.4) and Adverse Reactions (6.2)].

In repeat-dose toxicology studies in rats, administration of oral vismodegib resulted in toxicities in bone and teeth. Effects on bone consisted of closure of the epiphyseal growth plate when oral vismodegib was administered for 26 weeks at ≥ 50 mg/kg/day (approximately ≥ 0.4 times the systemic exposure (AUC) in patients at the recommended human dose). Abnormalities in growing incisor teeth (including degeneration/necrosis of odontoblasts, formation of fluid-filled cysts in the dental pulp, ossification of the root canal, and hemorrhage resulting in breakage or loss of teeth) were observed after administration of oral vismodegib at ≥ 15 mg/kg/day (approximately ≥ 0.2 times the AUC in patients at the recommended human dose).

8.5 Geriatric Use
Clinical studies of ERIVEDGE capsule did not include sufficient numbers of patients aged 65 and over to determine whether they respond differently from younger patients.

8.6 Hepatic Impairment
No dose adjustment is required in patients with hepatic impairment [see Clinical Pharmacology (12.3)].

8.7 Renal Impairment
No dose adjustment is required in patients with renal impairment [see Clinical Pharmacology (12.3)].

10 OVERDOSAGE
There is no information on overdosage in humans. In clinical trials, ERIVEDGE capsule was administered at 540 mg orally once daily; exposure did not increase between 150 mg and 540 mg daily.

11 DESCRIPTION
Vismodegib is an inhibitor of the hedgehog (Hh) signaling pathway, which is described chemically as 2-Chloro-N-(4-chloro-3-(pyridin-2-yl)phenyl)-4-(methylsulfonyl)benzamide. The molecular formula is C$_{19}$H$_{14}$Cl$_{2}$N$_{2}$O$_{3}$S. The molecular weight is 421.30 g/mol and the structural formula is:

![Structural formula of Vismodegib]

Vismodegib is a crystalline free base with a pKa (pyridinium cation) of 3.8, appearing as a white to tan powder. The solubility of vismodegib is pH dependent with 0.1 μg/mL at pH 7 and 0.99 mg/mL at pH 1. The partition coefficient (log P) is 2.7.

Each ERIVEDGE (vismodegib) capsule for oral administration contains 150 mg vismodegib and the following inactive ingredients: microcrystalline cellulose, lactose monohydrate, sodium lauryl sulfate, povidone, sodium starch glycolate, talc, and magnesium stearate (non-bovine). The capsule shell contains gelatin, titanium dioxide, red iron oxide, and black iron oxide. The black printing ink contains shellac and black iron oxide.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action
Vismodegib is an inhibitor of the Hedgehog pathway. Vismodegib binds to and inhibits Smoothened, a transmembrane protein involved in Hedgehog signal transduction.

12.2 Pharmacodynamics
Cardiac Electrophysiology
The QTc interval was not affected by therapeutic doses of ERIVEDGE in a thorough QTc trial.

12.3 Pharmacokinetics
Absorption
The single dose absolute bioavailability of vismodegib is 31.8%. Absorption is saturable as evidenced by the lack of dose proportional increase in exposure after a single dose of 270 mg or 540 mg vismodegib. ERIVEDGE capsule may be taken without regard to meals because the systemic exposure of vismodegib at steady state is not affected by food.

Distribution
The volume of distribution of vismodegib ranges from 16.4 to 26.6 L. Vismodegib plasma protein binding in patients is greater than 99%. Vismodegib binds to both human serum albumin and alpha-1-acid glycoprotein (AAG) and binding to AAG is saturable.
In a pharmacokinetic study, male patients (n=3) had an average concentration of vismodegib in semen on day 8 that was 6.5% of the average steady state concentration (C_{ss}) observed in plasma.

**Metabolism**

Greater than 98% of the total circulating drug-related components are the parent drug. Metabolic pathways of vismodegib in humans include oxidation, glucuronidation, and pyridine ring cleavage. The two most abundant oxidative metabolites recovered in feces are produced *in vitro* by recombinant CYP2C9 and CYP3A4/5.

**Elimination**

Vismodegib and its metabolites are eliminated primarily by the hepatic route with 82% of the administered dose recovered in the feces and 4.4% recovered in urine. The estimated elimination half-life ($t_{1/2}$) of vismodegib is 4 days after continuous once-daily dosing and 12 days after a single dose.

**Specific Populations**

**Hepatic Impairment:** In a dedicated clinical study, the mean systemic exposure (AUC 0-24hr) of vismodegib was increased by 24% in patients with mild (n=8), 31% in patients with moderate (n=6) and decreased 14% in patients with severe (n=3) hepatic impairment when compared to patients with normal hepatic function (n=9) after 8 days of daily ERIVEDGE administration. The NCI Organ Dysfunction Working Group criteria for hepatic impairment were used in the study. Mild hepatic impairment was defined as normal total bilirubin and aspartate transaminase (AST) > upper limit of normal (ULN) or total bilirubin > 1.0 to 1.5 times ULN, moderate hepatic impairment as total bilirubin > 1.5 to 3.0 times ULN, and severe hepatic impairment as total bilirubin > 3.0 to 10.0 times ULN.

**Renal Impairment:** Renal excretion of vismodegib after oral administration of ERIVEDGE is low (<5%). The population pharmacokinetic analysis suggested no clinically relevant effect of renal impairment on the systemic exposure of vismodegib, based on pharmacokinetic data from patients with mild (CLcr 50 to 79 mL/min, n=58), and moderate (CLcr 30 to 49 mL/min, n=16) renal impairment.

**Weight, Age, and Sex:** The results of a population pharmacokinetic analysis suggested no clinically relevant effect of weight (range: 41-140 kg), age (range: 26-89 years), and sex on the systemic exposure of vismodegib.

**Drug Interaction Studies**

**Effect of Drugs on Vismodegib:** Coadministration of ERIVEDGE with fluconazole (a moderate CYP2C9 inhibitor and moderate CYP3A4 inhibitor) increased mean AUC_{0-24hr} and steady-state concentrations of vismodegib by 1.3-fold in healthy subjects. A strong inhibitor of CYP3A4 and P-gp (itraconazole) or a proton pump inhibitor (rabeprazole) had no effect on the steady-state systemic exposure of vismodegib when coadministered with ERIVEDGE in healthy subjects.

**Effects of Vismodegib on Other Drugs:** Results of a drug interaction study conducted in cancer patients demonstrated that the systemic exposure of rosiglitazone (a CYP2C8 substrate) or oral contraceptives (ethinyl estradiol and norethindrone) is not altered when either drug is coadministered with vismodegib.

In *vitro* studies suggest that vismodegib is an inhibitor of CYP2C8, CYP2C9, CYP2C19 and the transporter BCRP and that vismodegib is not an inducer of CYP1A2, CYP2B6, or CYP3A.

13 **NONCLINICAL TOXICOLOGY**

13.1 **Carcinogenesis, Mutagenesis, Impairment of Fertility**

Carcinogenicity studies with vismodegib have not been conducted. Pilomatricoma (a benign cutaneous neoplasm) was observed in rats administered oral vismodegib for 26 weeks at
100 mg/kg/day (approximately 0.8 times the systemic exposure (AUC) in patients at the recommended human dose).

Vismodegib was not mutagenic in the in vitro bacterial reverse mutation (Ames) assay and was not clastogenic in the in vitro human chromosomal aberration assay in human peripheral blood lymphocytes or in the in vivo rat bone marrow micronucleus assay.

In a dedicated 26-week rat fertility study, no effects on male reproductive organs or fertility endpoints were observed at vismodegib doses of 100 mg/kg/day (approximately 1.3-times the steady-state AUC_0-24h at the recommended human dose) either at the end of dosing or following a 16 week recovery phase. While there were increased numbers of degenerating germ cells and hypospermia in sexually immature dogs observed at ≥ 50 mg/kg/day in the 4-week general toxicity study, there were no effects on male reproductive organs in sexually mature rats and dogs, in the vismodegib general toxicity studies of up to 26-weeks.

In a female fertility study, treatment of rats with vismodegib at 100 mg/kg/day (approximately 1.2-fold of the steady-state AUC_0-24h at the recommended human dose) for 26-weeks prior to mating resulted in decreased implantations, increased percent preimplantation loss, and decreased numbers of dams with viable embryos. No vismodegib-related changes in fertility were observed following a 16-week recovery period. In a 26-week general toxicity study in rats, decreased numbers of corpora lutea were observed at 100 mg/kg/day; the effect was not reversed by the end of an 8-week recovery period.

13.2 Animal Toxicology

Neurologic effects characterized as limb or body tremors or twitching were observed in rats administered oral vismodegib for 4 weeks or longer at ≥50 mg/kg/day (approximately ≥0.4 times the AUC in patients at the recommended human dose). These observations resolved upon discontinuation of dosing and were not associated with microscopic findings.

14 CLINICAL STUDIES

A single, international, single-arm, multi-center, open-label, 2-cohort trial was conducted in 104 patients with either metastatic basal cell carcinoma (mBCC) (n = 33) or locally advanced BCC (laBCC) (n = 71). Patients with laBCC were required to have lesions that had recurred after radiotherapy, unless radiotherapy was contraindicated or inappropriate (e.g. Gorlin syndrome; limitations because of location of tumor or cumulative prior radiotherapy dose), and where the lesions were either unresectable or surgical resection would result in substantial deformity. Patients were to receive 150 mg vismodegib per day orally until disease progression or unacceptable toxicity.

The major efficacy outcome measure of the trial was objective response rate (ORR) as assessed by an independent review facility (IRF). In the mBCC cohort, tumor response was assessed according to the Response Evaluation Criteria in Solid Tumors (RECIST) version 1.0. In the laBCC cohort, tumor response evaluation included measurement of externally assessable tumor (including scar) and assessment for ulceration in photographs, radiographic assessment of target lesions (if appropriate), and tumor biopsy. An objective response in laBCC required at least one of the following criteria and absence of any criterion for disease progression: (1) ≥ 30% reduction in lesion size [sum of the longest diameter (SLD)] from baseline in target lesions by radiographic assessment; (2) ≥ 30% reduction in SLD from baseline in externally visible dimension of target lesions; (3) complete resolution of ulceration in all target lesions. Complete response was defined as objective response (as defined above) with no residual BCC on sampling tumor biopsy. Disease progression was defined as any of the following: (1) ≥20% increase in the SLD from nadir in target lesions (either by radiography or by externally visible dimension); (2) new ulceration of target lesions persisting without evidence of healing for at least 2 weeks; (3) new lesions by radiographic assessment or physical examination; (4) progression of non-target lesions by RECIST.
Of the 104 patients enrolled, 96 patients were evaluable for ORR. Twenty-one percent of patients carried a diagnosis of Gorlin syndrome. The median age of the efficacy evaluable population was 62 years (46% were at least 65 years old), 61% male and 100% White. For the mBCC cohort (n = 33), 97% of patients had prior therapy including surgery (97%), radiotherapy (58%), and systemic therapies (30%). For the laBCC cohort (n = 63), 94% of patients had prior therapies including surgery (89%), radiotherapy (27%), and systemic/topical therapies (11%). The median duration of treatment was 10.2 months (range 0.7 to 18.7 months).

The key outcome measures are presented in Table 2, below.

**Table 2: Objective Response Rate: Efficacy-Evaluable Patients**

### 16 HOW SUPPLIED/STORAGE AND HANDLING

Each ERIVEDGE (vismodegib) capsule has a pink opaque body and a grey opaque cap with “150 mg” printed on the capsule body and “VISMO” printed on the capsule cap in black ink. ERIVEDGE capsules are available in bottles of 28 capsules (NDC 50242-140-01).

Store at room temperature 20°C to 25°C (68°F to 77°F); excursions permitted between 15°C to 30°C (59°F to 86°F) [see USP Controlled Room Temperature].

Keep the bottle tightly closed in order to protect from moisture.

### 17 PATIENT COUNSELING INFORMATION

See *FDA-approved patient labeling (Medication Guide)*.

**Administration Instructions**

- Advise patients to swallow ERIVEDGE capsules whole and not to crush or open the capsules.

**Embryo-Fetal Toxicity**

- Advise pregnant women of the potential risk to a fetus [see *Warnings and Precautions (5.1) and Use in Specific Populations (8.1)*].
• Advise females of reproductive potential to use effective contraception during therapy with and for 24 months after the final dose of ERIVEDGE [see Warnings and Precautions (5.1) and Use in Specific Populations (8.1, 8.3)].

• Advise males, even those with prior vasectomy, to use condoms to avoid potential drug exposure in both pregnant partners and female partners of reproductive potential during therapy with and for 3 months after the final dose of ERIVEDGE [see Warnings and Precautions (5.1) and Use in Specific Populations (8.1, 8.3)].

• Advise female patients and female partners of male patients to contact their healthcare provider with a known or suspected pregnancy. Report pregnancies to Genentech at 1-888-835-2555 [see Warnings and Precautions (5.1) and Use in Specific Populations (8.1, 8.3)].

Semen Donation

• Advise males not to donate semen during therapy with and for 3 months after the final dose of ERIVEDGE.

Lactation

• Advise women that breastfeeding is not recommended during therapy with ERIVEDGE and for 24 months after the final dose [see Use in Specific Populations (8.2)].

Blood Donation

• Advise patients not to donate blood or blood products while taking ERIVEDGE and for 24 months after the final dose of ERIVEDGE.

Premature Fusion of the Epiphyses

• Advise patients and caregivers that premature fusion of the epiphyses has been reported in pediatric patients exposed to ERIVEDGE. In some cases, fusion progressed after drug discontinuation.

ERIVEDGE® [vismodegib] capsule

What is the most important information I should know about ERIVEDGE?

ERIVEDGE can cause your baby to die before it is born (be stillborn) or cause your baby to have severe birth defects.

For females who can become pregnant:
- You should talk with your healthcare provider about the risks of ERIVEDGE to your unborn child.
- Your healthcare provider will do a pregnancy test before you start taking ERIVEDGE.
- In order to avoid pregnancy, you should use birth control during treatment and for 24 months after your final dose of ERIVEDGE. Talk with your healthcare provider about what birth control method is right for you during this time.
- Talk to your healthcare provider right away if you have unprotected sex or if you think that your birth control has failed.
- Tell your healthcare provider right away if you become pregnant or think that you may be pregnant.

For males:
- ERIVEDGE is present in semen. Do not donate semen while you are taking ERIVEDGE and for 3 months after your final dose.
- You should always use a condom, even if you have had a vasectomy, during sex with female partners who are pregnant or who are able to become pregnant, during treatment with ERIVEDGE and for 3 months after your final dose to protect your female partner from being exposed to ERIVEDGE.
- Tell your healthcare provider right away if your partner becomes pregnant or thinks she is pregnant while you are taking ERIVEDGE.

Exposure to ERIVEDGE during pregnancy:
If you think that you or your female partner may have been exposed to ERIVEDGE during pregnancy, talk to your healthcare provider right away. If you become pregnant during treatment with ERIVEDGE, you or your healthcare provider should report your pregnancy to Genentech at 1-888-835-2555.

What is ERIVEDGE?
ERIVEDGE is a prescription medicine used to treat adults with a type of skin cancer, called basal cell carcinoma, that has spread to other parts of the body, or that has come back after surgery or that your healthcare provider decides cannot be treated with surgery or radiation.

It is not known if ERIVEDGE is safe and effective in children.

What should I tell my healthcare provider before taking ERIVEDGE?
Before taking ERIVEDGE, tell your healthcare provider if you:
- are pregnant or plan to become pregnant. See “What is the most important information I should know about ERIVEDGE?”
- are breastfeeding or plan to breastfeed. It is not known if ERIVEDGE passes into your breast milk. You should not breastfeed during treatment and for 24 months after your final dose of ERIVEDGE. Talk to your healthcare provider about the best way to feed your baby during this time.

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements.

How should I take ERIVEDGE?
- Take ERIVEDGE exactly as your healthcare provider tells you.
- You can take ERIVEDGE with or without food.
- Swallow ERIVEDGE capsules whole. Do not open or crush the capsules.
- Take ERIVEDGE one time each day.
- If you miss a dose, skip the missed dose. Just take your next scheduled dose.

What should I avoid while taking ERIVEDGE?
- Do not donate blood or blood products while you are taking ERIVEDGE and for 24 months after your final dose.
- Do not donate semen while you are taking ERIVEDGE and for 3 months after your final dose.

What are the possible side effects of ERIVEDGE?
ERIVEDGE can cause serious side effects, including:
- See “What is the most important information I should know about ERIVEDGE?”
- Bone growth problems. Bone growth problems have happened in children who have been exposed to ERIVEDGE. These problems may continue even after stopping treatment with ERIVEDGE.
The most common side effects of ERIVEDGE are:

- muscle spasms
- hair loss
- change in how things taste or loss of taste
- weight loss
- tiredness
- nausea
- diarrhea
- decreased appetite
- constipation
- joint pain
- vomiting

ERIVEDGE can cause absence of menstrual periods (amenorrhea) in females who are able to become pregnant. It is not known if amenorrhea is permanent. Talk to your healthcare provider if you have concerns about fertility.

These are not all the possible side effects of ERIVEDGE.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

You may also report side effects to Genentech, Inc. at 1-888-835-2555.

How should I store ERIVEDGE?

- Store ERIVEDGE at room temperature between 68°F to 77°F (20°C to 25°C).
- Keep the bottle tightly closed to protect ERIVEDGE from moisture.

Keep ERIVEDGE and all medicines out of the reach of children.

General information about the safe and effective use of ERIVEDGE

Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use ERIVEDGE for a condition for which it was not prescribed. Do not give ERIVEDGE to other people, even if they have the same symptoms that you have. It may harm them. You can ask your pharmacist or healthcare provider for information about ERIVEDGE that is written for health professionals.

What are the ingredients in ERIVEDGE?

Active ingredient: vismodegib

Inactive ingredients: microcrystalline cellulose, lactose monohydrate, sodium lauryl sulfate, povidone, sodium starch glycolate, talc, magnesium stearate (non-bovine). The capsule shell contains gelatin, titanium dioxide, red iron oxide, and black iron oxide. The black printing ink contains shellac and black iron oxide.
